### **Vanished wet season of 1952 has eerie similarities to NT's current dry spell**

The Northern Territory's wet season, or lack thereof, may be one for the record books.

The Bureau of Meteorology believes Darwin could be on track for its driest wet season on record, measuring 890 millimetres of rainfall — just over half the average.

### **Heatwatch: increasing extreme heat in Townsville**

20 Mar 2019

Mark Ogge, Bill Browne, Travis Hughes

The Australia Institute

Increasing extreme heat will have profound impacts on people, industries and ecosystems in Townsville. CSIRO and Bureau of Meteorology projections estimate that the average number of days over 35 degrees each year could increase fivefold by 2030 and reach over one hundred days per year by 2090 without strong climate policies. Almost two hundred nights per year could to remain above 25 degrees by 2090, a level considered dangerous to human health.

**Death toll from Papua flooding rises, amid fears for children**

Indonesian officials say the death toll from flooding and landslides in Papua has risen to 89, while dozens of people remain missing.

**Australia: Tropical Cyclone Trevor forms, on track to target northern Queensland this week**

#### **Nebraska Flooding Seen from Space in Dramatic Detail**

A new series of before-and-after images shows the ongoing flooding in Nebraska in jaw-dropping detail.

The images, created by the European Union's Earth-observation program, Copernicus, show rivers turned to lakes and farms and towns underwater. The record flooding is the result of a "bomb cyclone" that struck the central U.S. last week. The term refers to a storm that forms outside of the tropics in which atmospheric pressure drops very rapidly.

### **International news and research**

#### **Rising CO2 Levels Could Wipe Out Stratocumulus Clouds, Accelerating Climate Change**

Stratocumulus clouds spread out like puffy cotton balls in orderly rows above the ocean in the sub-tropics. The low-hovering clouds provide the planet shade and help keep Earth cool. But in a new study published this week, researchers say that rising carbon dioxide levels in the atmosphere could wipe out these clouds. The discovery means that, under "business as usual" emissions scenarios, Earth could heat up 14 degrees Fahrenheit within a century.

#### **We're The Geeks Who Have Protected the Public From Weather Extremes For 100 Years**

Newsweek

In the 21st century, the societal impact of the meteorology community is vast, extending well beyond the daily “should I take my umbrella today?”

### **The 'Frozen Chosen': What's it like to live, work in the northernmost permanently inhabited place on Earth?**

Not many people could imagine braving a location situated in a climate so extreme that it is considered unsuitable for human habitation.

Once you factor in the snow that falls all year round, the 24 hours of darkness during frigid winter months and the mere 508-mile distance from the North Pole, it's no wonder that so few people live and work in the northernmost permanently inhabited settlement on Earth – Alert, located in the most northerly Canadian territory of Nunavut.

#### **Sea Level Rise & New Zealand's Future**

How much land will we lose to the rising ocean, and what will it cost us? Local Government New Zealand has recently released its report, *Vulnerable: The quantum of local government owned infrastructure exposed to sea level rise*, which quantifies the replacement value of local government infrastructure exposed to sea level rise. The study details the type, the quantity and the replacement value of infrastructure exposed with different levels of rise severity, from half a meter to three metres. How bad could it get? Very bad: more than \$14 billion of local government owned assets are exposed at a 3.0 metre increment of sea level rise.

LGNZ's report is intended to result in stakeholders working together to ensure the long-term resilience of critical infrastructure. At its core, this analysis is about turning a challenge into an opportunity. Study co-author Thomas Simonson will present these findings in detail at a lunch time lecture, and take questions from the audience.

When: Thursday April 18th 12:30pm – 1:30pm  
Where: Rutherford House lecture theatre 2 (RHLT2)

### Examining relationships between cloud-resolving model parameters and total flash rates to generate lightning density maps

Christophe Bovalo, Christelle Barthe, Jean-Pierre Pinty

Version of Record online: 05 March 2019

Lightning density maps are produced in a cloud-resolving model using two methods: with an explicit lightning scheme and based on calibrated proxies. These proxies (graupel mass, updraught volume for  $w > 10$  m/s, precipitating and non-precipitating ice mass flux product and maximum updraught) are related to lightning rate densities through linear relationships. Results are illustrated on the 24 September 2012 case over France. It shows that the total graupel mass is a good estimator of lightning activity.

Meteorologists Are Among Female Scientists Wearing Purple On Pi Day - Here's Why?

March 14, 2019 - Forbes

March 14 is Pi Day, which celebrates the mathematical constant  $\pi$  (pi). In 2019, many women rallied around the day as #DressForStem Day. What is that, and why is it so important?
