

New Zealand weather and climate news

(MetService focus)

Wet and windy start to rollercoaster weather week

"We're going to see the rain coming fine by the afternoon, that's for most of the country," said MetService forecaster Toporo Marsters.

Heavy rain, 110kmh winds could bring slips, flooding and powerline damage

MetService meteorologist Andrew James previously said the bad weather was due to a complex low-pressure system in the Tasman Sea that would move over the entire country on Sunday and into Monday.

Weather to force Mother's Day celebrations indoors

Stuff.co.nz

The system will continue to move over the country and bring rain to the eastern parts in the evening, MetService meteorologist Andrew James said.

Auckland weather: crews still working to restore power to some homes

Some Auckland homes remain without power this morning after strong winds yesterday evening and through the night.

Low weather system packing a punch this evening, bringing heavy rain and strong winds to many

Last week, temperatures were warmer than average for May due to a predominant northerly flow, MetService meteorologist Stephen Glassey said.

Drizzly start but mild week for Hawke's Bay

But meteorologist Stephen Glassey said while Hawke's Bay's temperatures won't reach 24 degrees like last Friday, the mild weather is set to continue.

Rain pummels Richmond, mall hit by flooding

Storm water banking could help Texas manage floods and droughts

A study has quantified the amount of water flowing in major Texas rivers during heavy rains and found that there is enough room in coastal aquifers to store most of it. This discovery means that capturing and storing water could be a feasible option for partially mitigating floods and droughts, which are both expected to increase in frequency and intensity as the climate changes.

NZ introduces groundbreaking zero carbon bill, including targets for agricultural methane

Robert McLachlan, Massey University

New Zealand's government has released a bill that sets targets to bring long-lived greenhouse gases to net zero by 2050 and reduce emissions of the shorter-lived methane by 10% within a decade.

Occurrence of back-to-back heat waves likely to accelerate with climate change

Researchers have provided the first estimation of the potential damage from back-to-back, or compound, heat waves, which the authors found will increase as global warming continues. But government warning systems and health-care outreach do not currently calculate the risks of sequential heat waves. Instead, risk and response are determined by the severity of individual episodes of extreme temperatures.

Climate change research funding on offer

The Ministry for Primary industries is calling for applications to the 2019/20 funding round for the Sustainable Land Management and Climate Change (SLMACC) Research Programme.

Māori seek direct input into govt's climate change policy

Māori leaders in the fight for climate change say the government needs to let Māori determine climate change policy - not just be consulted.

Application of a Bayesian inflation approach to EnSRF radar data assimilation to improve the analysis and forecasting of an MCS

Shibo Gao, Jinzhong Min, Limin Liu, Chuanyou Ren

Version of Record online: 10 May 2019

A spatially and temporally varying Bayesian inflation algorithm was applied to the assimilation of the real radar data of a mesoscale convective system (MCS) using the ensemble square root filter (EnSRF) within the advanced regional prediction system (ARPS). The results indicated that the analysis and forecast of the MCS using the Bayesian inflation method appeared better than when using the multiplicative inflation method. Quantitative reflectivity and precipitation forecast skill were also improved in the Bayesian inflation experiment.

Observed changes in climate extremes in Nigeria

Imoleayo E. Gbode, Oluwafemi E. Adeyeri, Kaah P. Menang, Joseph D. K. Intsiful, Vincent O. Ajayi, Jerome A. Omotosho, Akintomide A. Akinsanola

Version of Record online: 09 May 2019

The spatio-temporal variation in the observed trends of climate indices over Nigeria shows a significant increase in the frequencies of warm spell, warm days and nights and decreasing cold spell, cold days and nights over the three climatic zones delineated. A significant increase in annual total precipitation was found in some stations across the Guinea coast and Sahel zones. Changes in consecutive dry days and consecutive wet days are non-significant in most stations. Also, a significant increase in extremely wet days was observed in a few stations across the three climatic zones. The implication of the observed warming could, however, result in thermal discomfort of lives in areas with significant positive trends. This could also exert pressure on the economy's power sector, as energy demand for cooling will increase. The increase in total annual precipitation will potentially be favourable for hydropower generation and increase the availability of the potable water supply for both industrial and domestic uses in the country. However, the increase in consecutive dry days and the decrease in consecutive wet days are dangerous for agricultural practices and, hence, food security.

Predicting impacts of climate change on the potential distribution of two interacting species in the forests of western Iran

Mansoureh Malekian, Maedeh Sadeghi

Version of Record online: 09 May 2019

Predicting the distribution of suitable habitats for species under climate change is essential for planning conservation strategies. The Persian squirrel is a poorly known species in the Middle East which is distributed in oak-dominated forests of western Iran. It might not be immediately obvious what a bushy-tailed rodent living in the forests of Iran can tell us about climate impacts. However, our results show the loss of suitable habitats for both species. Our results can help to identify priority areas for the long term conservation of species and should be used to inform adaptive conservation management in the face of future climate change.
